

Introduction to Software Development

by Derek Peacock

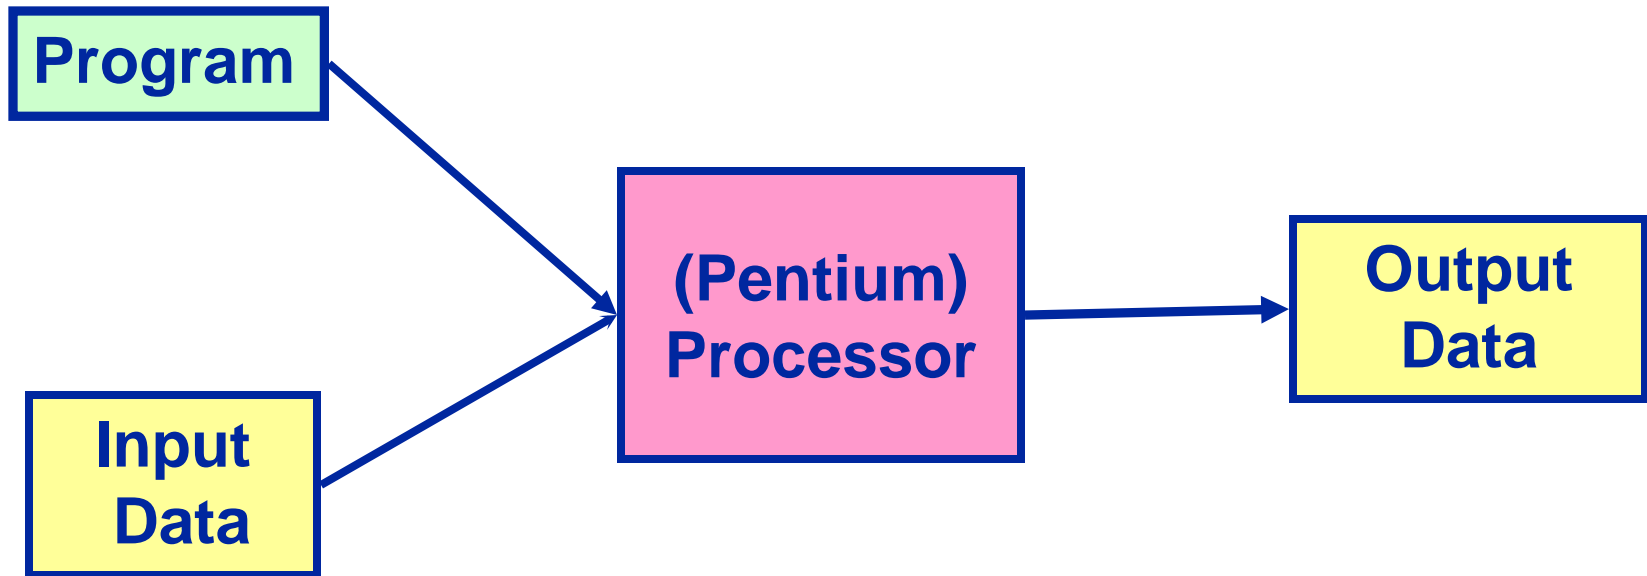

What is a Computer ?

- ⑥ Electronic
- ⑥ Information
- ⑥ Processing
- ⑥ Machine

Basic System

Computer Programs

☞ A sequence of **coded instructions** fed into a computer to enable it to perform specified operations upon data

Program = Set of cooperating Classes

Class = Operations and Data

Operations

☞ Procedures for the solution to a problem in a finite number of steps

1. Get the amount in GBP
2. Get the exchange rate
3. Calculate the amount in Euros
4. Display the result in Euros

Data & Data Structures

☞ Observations

☞ Facts

☞ Measurements

☞ Attributes

☞ Values

☞ Real or imaginary

☞ Lists

☞ Queues

☞ Stacks

☞ Tables

☞ Records

☞ Trees

Program Languages

☞ Machine Code

☞ C/C++

☞ Visual Basic

☞ Java

☞ Delphi (Pascal)

☞ COBOL

☞ SQL

☞ Assembler

☞ PL/1

☞ ADA

☞ Small Talk

☞ SNOBOL

☞ FORTRAN

☞ LISP

Machine Code (Low Level)

0E E8 D9 01

0E E8 45 02

B8 3E 01 1E

50 1E 50 B8

`Assembler

LD A, 01

LD B, 02

Add A, B

☞ Total Flexibility

☞ Very Fast

☞ Many Instructions

☞ Difficult to read

☞ Difficult to Debug

Operations in English

☞ Work out the equivalent amount in Euros for a given amount in GBP

English

- ⌚ Imprecise
- ⌚ Ambiguous
- ⌚ Very Large Dictionary
- ⌚ Same word can have different meanings
- ⌚ Rules of grammar complex and inconsistent

Visual Basic.NET

- ☞ Easier to Learn
- ☞ Visual Design
- ☞ Object Oriented
- ☞ Microsoft Support
- ☞ .NET support
- ☞ Visual Studio

Visual Basic Operation

```
Private sub Calculate_Euros
```

```
    inputAmount = txtInput.Text
```

```
    exchangeRate = txtRate.Text
```

```
    Euros = inputAmount * exchangeRate
```

```
    txtOutputAmount.Text = euros
```

```
End sub
```

- ☞ Platform Independent
- ☞ Not by Microsoft (by Sun)
- ☞ Object Oriented
- ☞ Web integration
- ☞ Visual IDEs
- ☞ Enterprise Level and Mobile device support

Java Operation

```
private void calculate_Euros()  
{  
    inputAmount = txtInput.getText()  
    exchangeRate = txtRate.getText()  
  
    Euros = inputAmount * exchangeRate  
  
    txtOutputAmount.setText(euros)  
  
}
```

- ☞ Leading Language
- ☞ Systems Language
- ☞ Fast Execution
- ☞ Object Oriented

```
Main()  
{  
    scanf("%d", &GBP);  
    scanf("%d", &ERate);  
    Euros = GBP * ERate  
    printf("Euros = ");  
    printf("%d", Euros);  
}
```

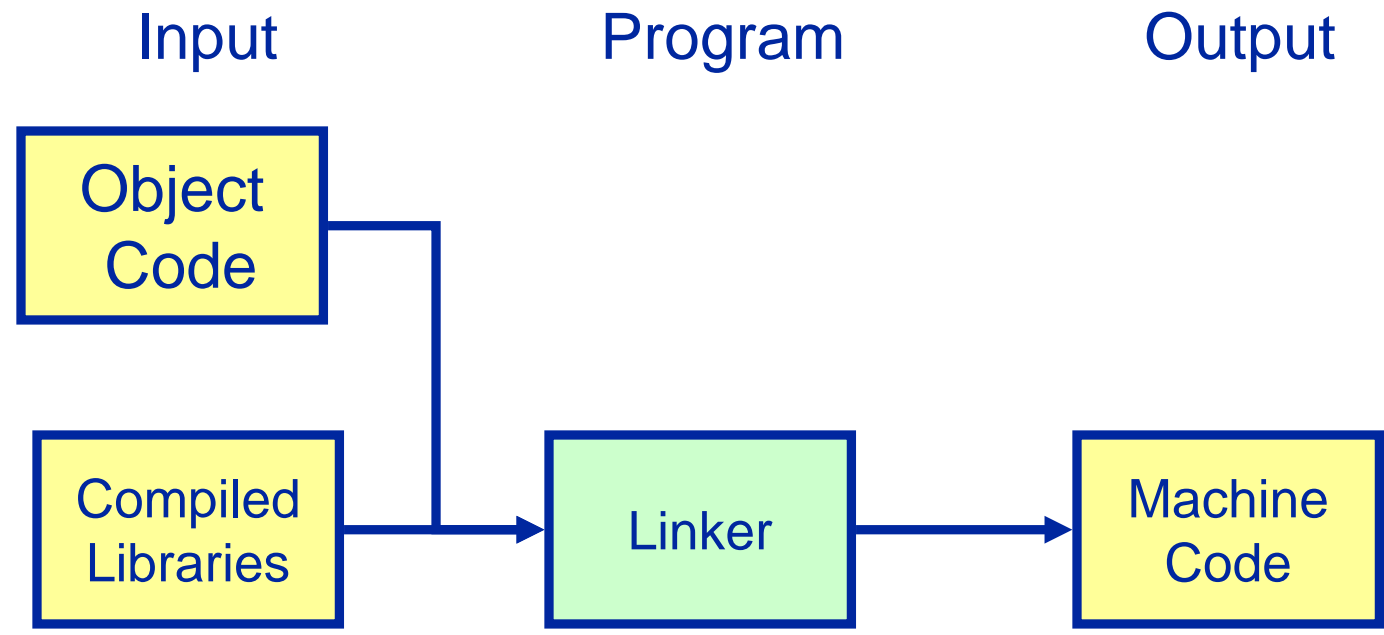

Compilation (translatation)

Linking (using pre-built libraries)

Execution (Run Program)

Input

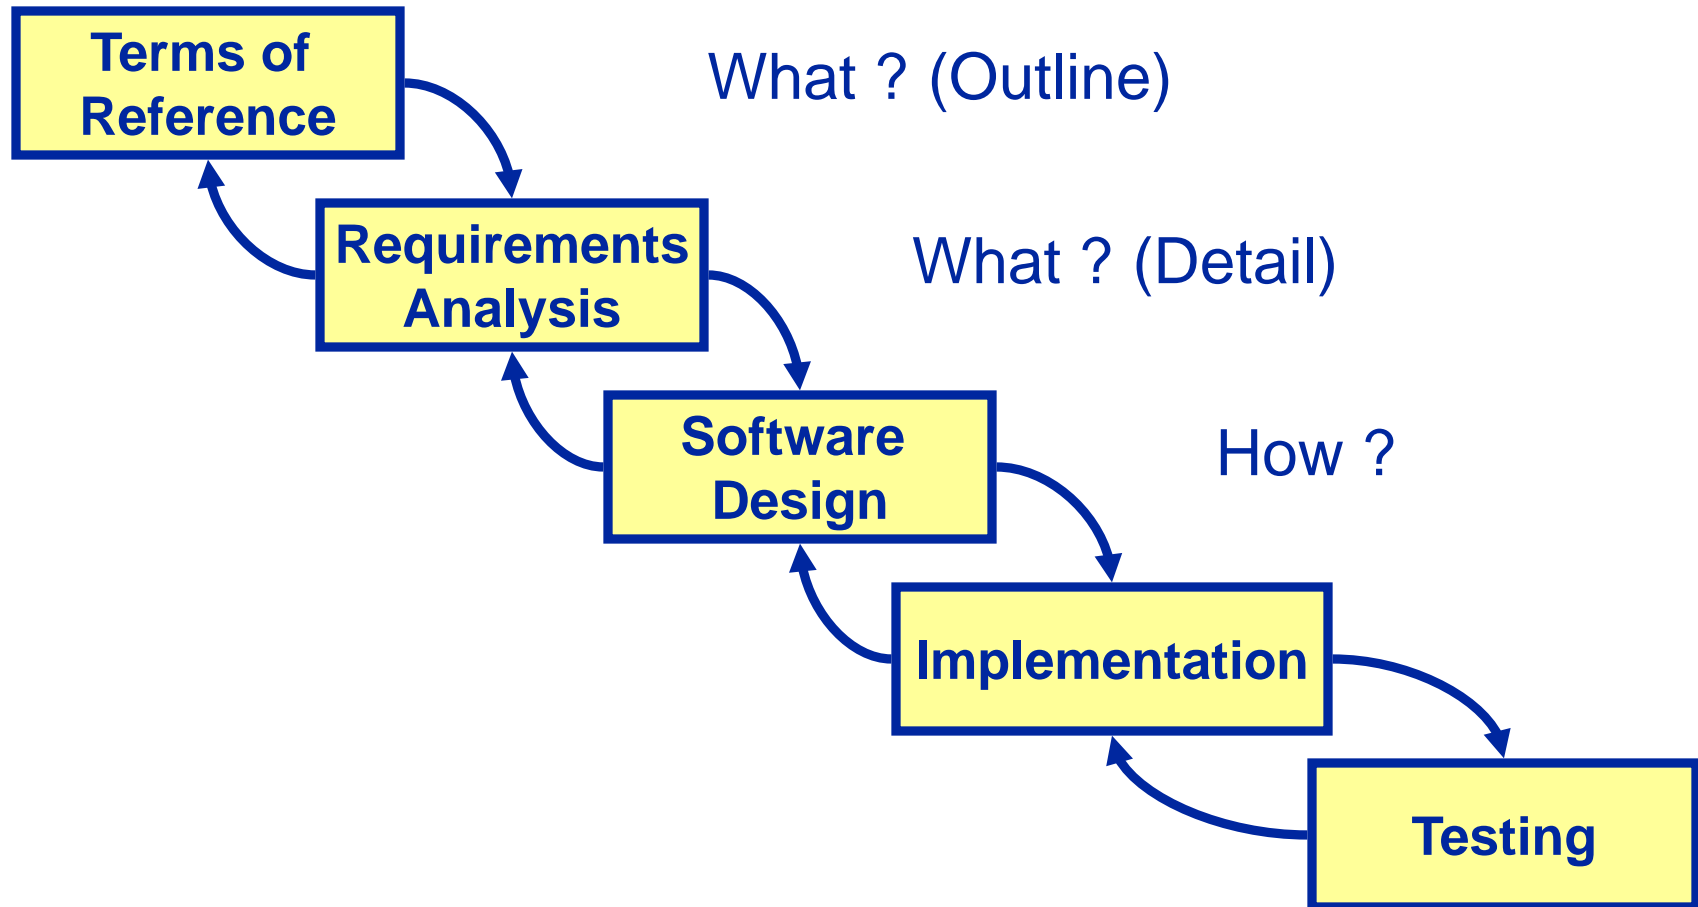

Program

Output

Software Development Life Cycle

Terms of Reference

☞ I need a program that I can use to calculate how many euros I will get for a given amount of British currency.

User Requirements

Euros Calculator

Amount £

Exchange

Amount €

Enter an amount in British currency and click on calculate

Euros Calculator

Amount £

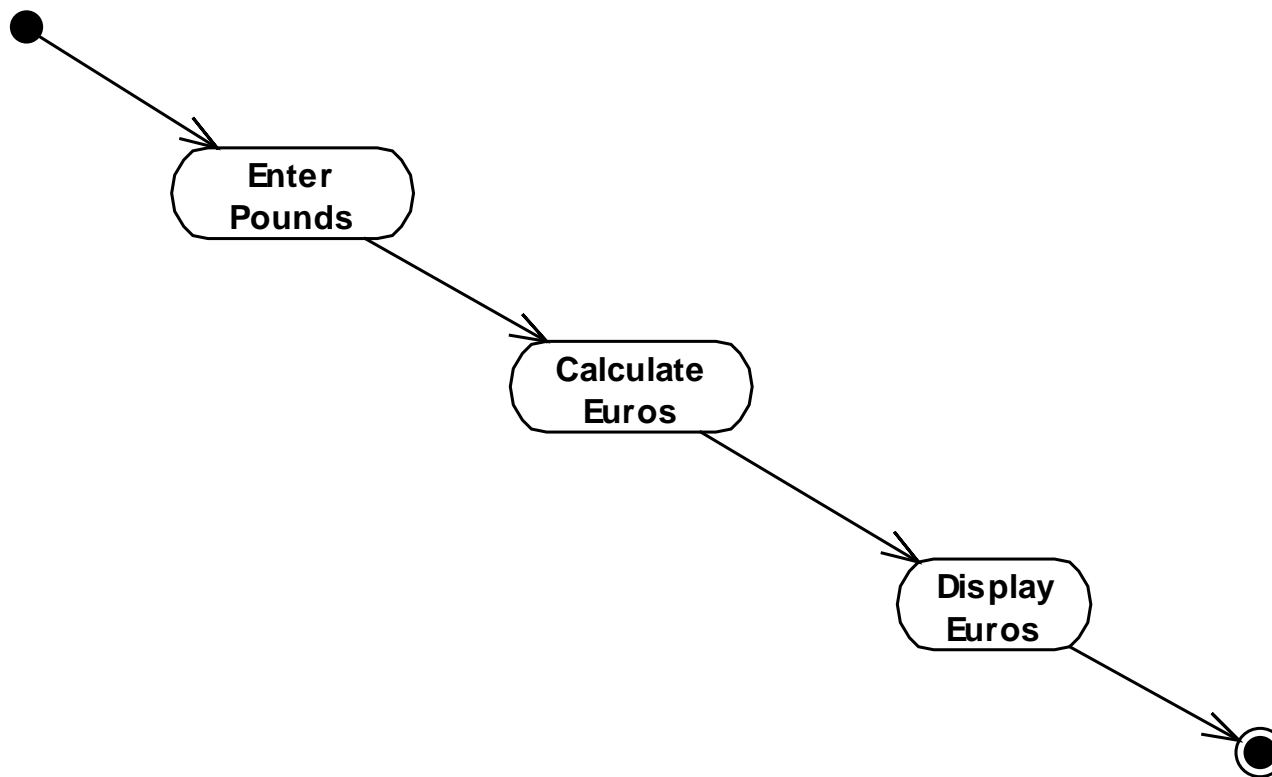

Exchange

Amount €

Enter an amount in British currency and click on calculate

Software Design

Implementation

```
procedure TfrmMain.btnCalculateClick(Sender: TObject);
var
  pounds : currency;
  euros  : currency;
  ERate  : Double;

begin

  btnCalculate.enabled := false;
  btnClear.Enabled     := true;

  pounds := strtofloat(edtGBP.Text);
  eRate  := strtofloat(edtERate.text);

  euros := pounds * ERate;

  edtEuros.Text := floattostr(euros);

end;
```

Testing

Function	Data	Expected	Actual
Calculate	GBP = 400 Erate = 1.5	Euros = 600	Euros = 600
Calculate	GPB = Erate =	Error Message	Error Message
Calculate	GPB = -400 Erate = 1.5	Error Message	Euros = -600
